SUMMARY

Senior software engineer with 13+ years of experience building .NET backends, desktop applications and React websites in agile teams. Skilled in agentic development, using Claude Code and Codex to deliver quality code

SKILLS

Back-end: C#, **.**NET, .NET Core, ASP.NET Web API, Entity Framework, SignalR
Front-end: React, TypeScript, WPF, XAML, Knockout.js, Angular, WinForms
Databases: SQL Server, MySQL, PostgreSQL, MongoDB
Cloud: Vercel, Azure App Services, Azure Cosmos DB, Azure WebJobs, Azure Service Bus
AI & Tools: Claude Code, OpenAI Codex/ChatGPT, TeamCity, Jenkins, Jira, git, DocuSign

EXPERIENCE

Freelance / Projects Apr 2022 – Present

- Built an agentic development workflow using Codex to automate Linear issue planning, adversarial code reviews, auto-merging of PRs, code formatting, quality checks, and deployments
- Built a responsive car maintenance tracker using Next.js, React, TypeScript, and Supabase/PostgreSQL, centralizing vehicle maintenance, reminders and spending reports with English/Spanish localization
- Built a full-stack family tree editor using React, TypeScript, Vite, and XYFlow, enabling users to visualize family relationships, autosave trees in IndexedDB and optionally auto-sync data to Google Drive
- Completed Full Stack Open (University of Helsinki): a 14-part course covering React, Redux, Node.js, Express, MongoDB, GraphQL and Typescript

Senior Software Engineer, TradePMR Mar 2019 – Apr 2022

- Streamlined account onboarding in a .NET Web API/WPF app by expanding the banking API integration, refactoring XAML/XML templates, and adding a DocuSign workflow for parallel multi-party signing
- Served as a rotating release owner: orchestrating deployments, coordinating cross-team work, managing Jenkins pipelines, and performing post-deployment monitoring
- Analyzed, fixed and tested Insecure Direct Object Reference vulnerabilities discovered through Penetration Testing by applying proper authorization, mitigating potential API security attacks
- Expanded a Global Relay compliance integration by capturing new sources of user communications, achieving a 5x increase in audit coverage and eliminating a flagged compliance gap
- Implemented alerts to warn users their accounts could run out of funds due to upcoming scheduled distributions and when account balances dropped below zero, reducing common client support tickets
- Migrated user reports, grids and user actions of the WPF desktop app to a React/Typescript web app

Senior Software Engineer, HarvestMark July 2017 – Mar 2019

- Created a business workflow using .NET Web API, Azure WebJobs and Cosmos DB paired with a WPF app to allow users to scan and link fresh produce trays with containers, increasing food traceability
- Built a web dashboard using Knockout.js and SignalR to visualize fresh produce trays inside containers in real time
- Extended and refactored a WPF desktop app using Catel.MVVM and Orchestra to support multiple concurrent QR code scanners, increasing throughput by 100%
- Built a barcode scanner emulator app using WPF allowing developers to debug and perform stress testing, removing dependency on (limited) physical hardware

Software Engineer II, Total Transit May 2017 – July 2017

- Built a 4-tier CI/CD pipeline (Local, Development, Staging and Production) using TeamCity and TFS to automate builds and deployments to IIS servers and Azure, improving deployment reliability and velocity

Software Engineer II, Tripwire June 2012 – Feb 2017

- Built a RESTful Web API in C# using .NET and Apache Lucene, enabling faster searches on collected log data and improve text filtering
- Developed a WPF app to test SSH connections, allowing the QA team to run security tests using different combinations of MAC and encryption algorithms
- Built importers and parsers for .EVT/.EVTX event logs and vulnerability scanner output, allowing Tripwire's SIEM to collect and analyze them
- Led initial efforts to create a test automation framework using Jenkins, Gradle and PowerShell, reducing manual testing effort of the QA team

Junior Software Engineer, KEMET Electronics Corporation Aug 2009 – June 2012

- Built apps using VB.NET, WinForms, MSSQL and Crystal Reports to process electronic equipment data, deliver reports and render visualizations, enabling Industrial Engineers and technicians to run quality control tests
- Developed a WinForms app and algorithm during my internship that analyzed upstream throughput and recommended when to power slow-starting machines on or off, reducing bottlenecks and saving energy

PROJECTS

Garage Guardian garageguardian.vercel.app

- Engineered dual-mode storage with IndexedDB for guests and Supabase cloud backup for authenticated users
- Built a Node.js pipeline transforming 50,407 vehicle records into 145 makes and 1,560 models, powering React autocomplete with paginated Supabase queries and caching to simplify vehicle entry

GENEalogical3 genealogical3.vercel.app

- Implemented Google Drive API integration with Node.js and OAuth 2.0, enabling persistent authenticated access
- Developed TypeScript graph algorithms to calculate kinship through breadth-first traversal and reject ancestry cycles, enabling accurate relationship labels; backed by Vitest coverage for data validation and editing workflows

EDUCATION

La Salle Victoria University 2005 – 2009

Bachelor's in Information and Computer Technology Engineering
